

Lesson 5 & 6

Entity Relationship ER Diagram

Entity Relationship Diagram (ER Diagram)

An entity relationship diagram (ERD) shows the **relationships** of entity sets stored in a database. An **entity** in this context is an object, a component of data. An entity set is a collection of similar entities. These entities can have **attributes** that define its properties.

By defining the entities, their attributes, and showing the relationships between them, an ER diagram illustrates the logical structure of databases.

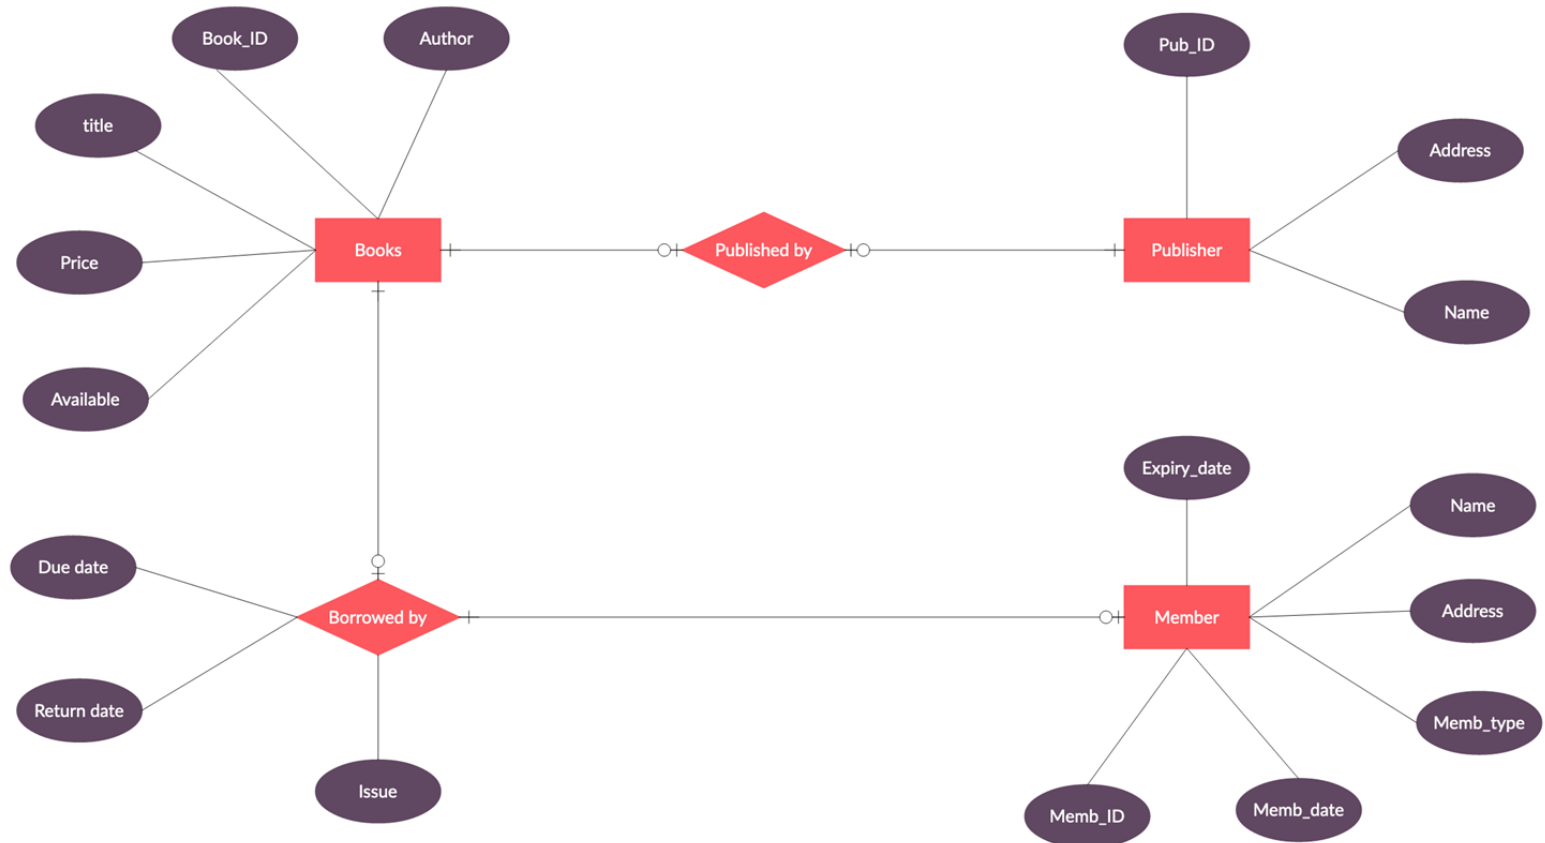

ER diagrams are used to **sketch out the design of a database**.

Entity Relationship Diagram (ER Diagram)

There are two reasons to create a database diagram. You're either designing a new schema or you need to document your existing structure.

Sample E-R Diagram

Common Entity Relationship Diagram Symbols - **Entity**

An ER diagram is a means of visualizing how the information a system produces is related. There are five main components of an ERD: **Entities**, which are represented by rectangles.

An entity is an object or concept about which you want to store information, such as a person/role (e.g. Student), object (e.g. Invoice), concept (e.g. Profile) or event (e.g. Transaction)

Common Entity Relationship Diagram Symbols - **Entity**

A **weak entity** is an entity that must be defined by a **foreign key** relationship with another entity as it cannot be uniquely identified by its own attributes alone.

Common Entity Relationship Diagram Symbols - **Entity**

A **weak entity**

	STRONG ENTITY	WEAK ENTITY
1.	Strong entity always has primary key.	While weak entity has partial discriminator key.
2.	Strong entity is not dependent of any other entity.	Weak entity is depend on strong entity.
3.	Strong entity is represented by single rectangle.	Weak entity is represented by double rectangle.
4.	Two strong entity's relationship is represented by single diamond.	While the relation between one strong and one weak entity is represented by double diamond.

Common Entity Relationship Diagram Symbols - **Attributes**

Sample E-R Diagram

Attributes, which are represented by ovals. A key attribute is the unique, distinguishing characteristic of the entity.

For example, an employee's social security number might be the employee's key attribute.

Common Entity Relationship Diagram Symbols - Attributes

Sample E-R Diagram

Composite Attribute

A **multi-valued** attribute can have more than one value. For example, an employee entity can have multiple skill values.

A **derived** attribute is based on another attribute. For example, an employee's monthly salary is based on the employee's annual salary.

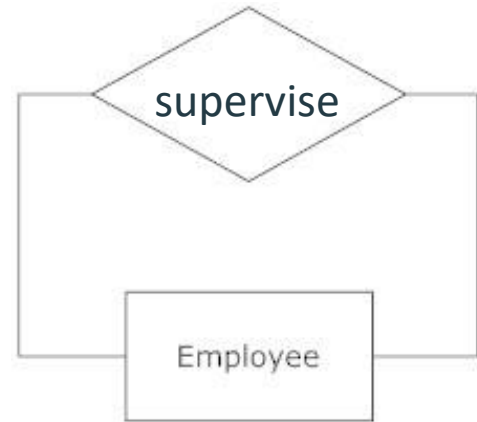

Common Entity Relationship Diagram Symbols - **Actions (Relationships)**

Actions, which are represented by diamond shapes, show how two entities share information in the database.

Common Entity Relationship Diagram Symbols - **Actions**

In some cases, entities can be self-linked.
For example, employees can **supervise** other employees.

Draw ER Diagram for the database

EMPLOYEE

Transfer the following verbal description into an ERM:

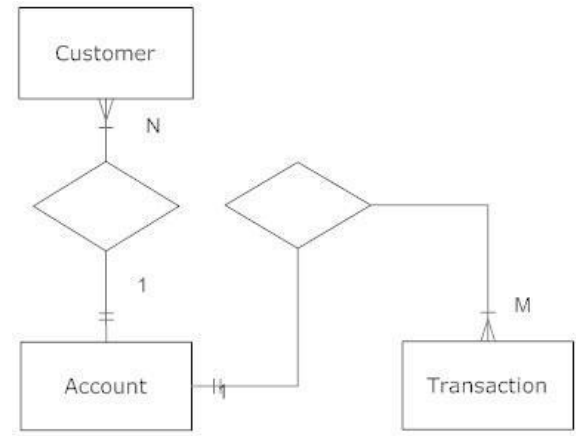

1. Customers (Cust-#) get discounts (Disc-#) on items (Item-#).
Each item can only have one discount rate.
2. Items belong to a single category (Categ-ID).

Common Entity Relationship Diagram Symbols - Cardinality

Cardinality specifies how many **instances** of an entity relate to one instance of another entity.

For example, **ONE** team has **MANY** players. When present in an ERD, the entity **Team** and **Player** are inter-connected with a one-to-many relationship.

The three common cardinal relationships are **one-to-one**, **one-to-many**, and **many-to-many**.

Cardinality

One-to-One cardinality

A **one-to-one** relationship is mostly used to split an entity in two to provide information concisely and make it more understandable.

The figure below shows an example of a one-to-one relationship.

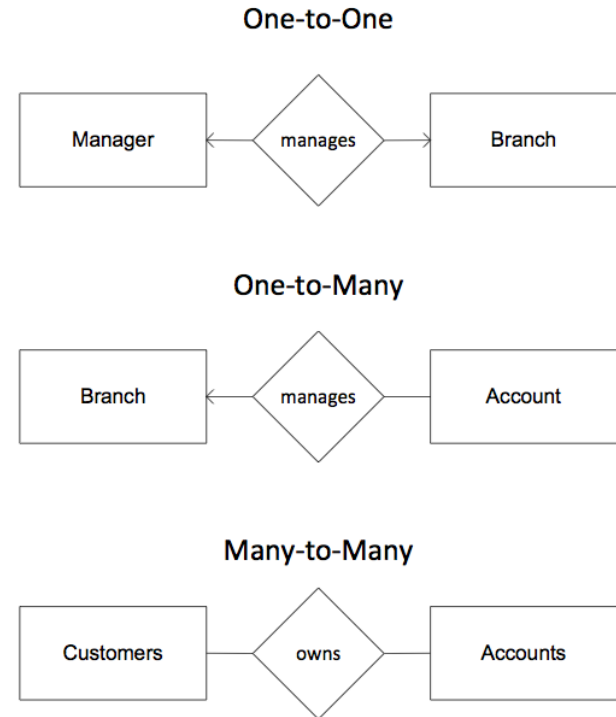

Cardinality

One-to-Many cardinality

A **one-to-many** relationship refers to the relationship between two entities X and Y in which an instance of X may be linked to many instances of Y, but an instance of Y is linked to only one instance of X.

The figure below shows an example of a one-to-many relationship.

Cardinality

Many-to-Many cardinality

A many-to-many relationship refers to the relationship between two entities X and Y in which X may be linked to many instances of Y and vice versa.

One-to-One

One-to-Many

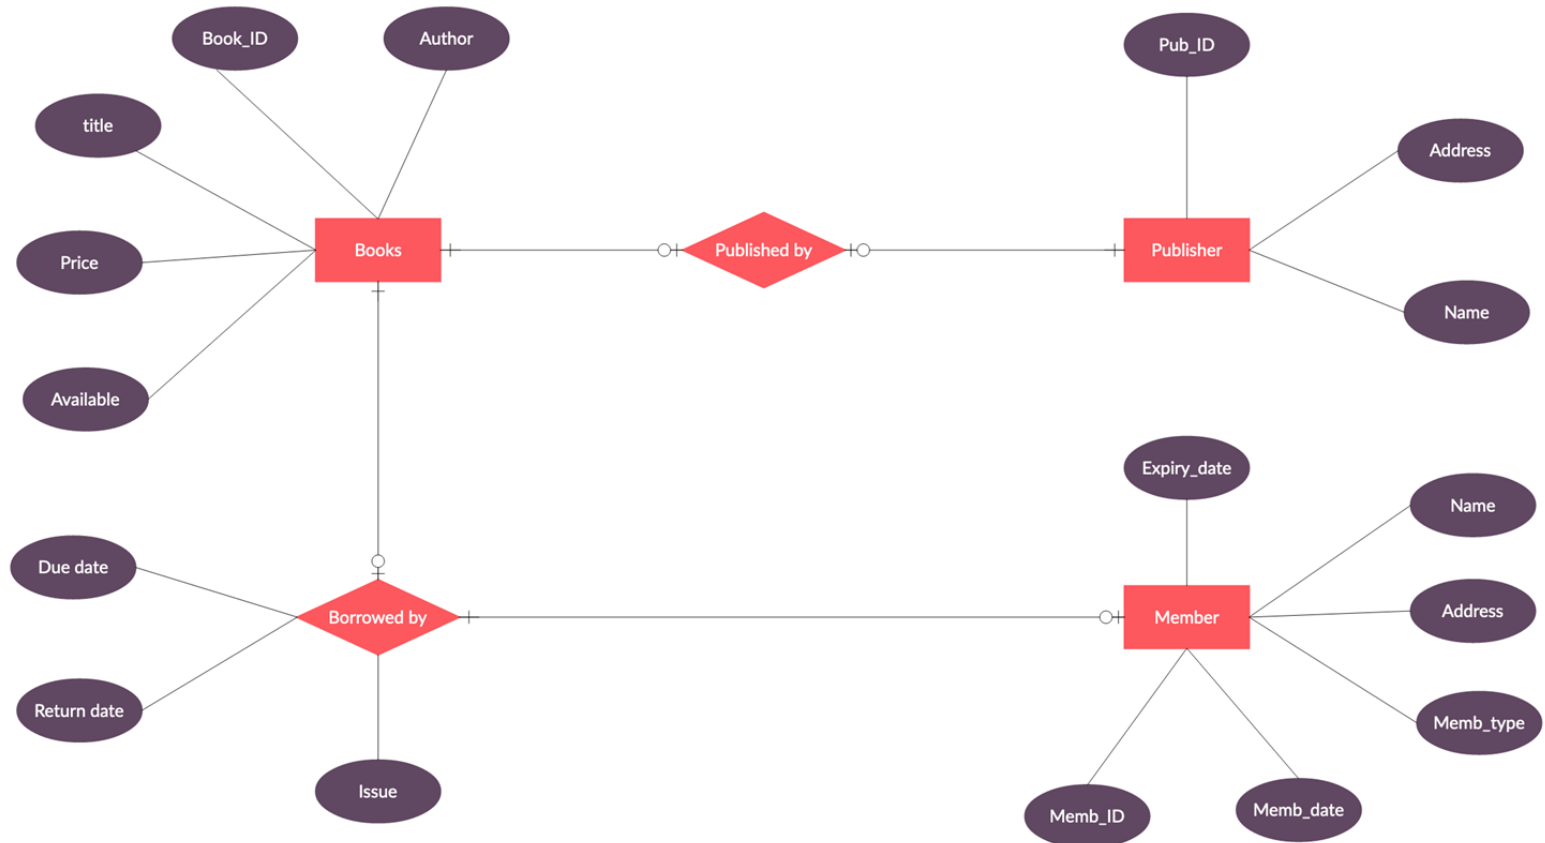

Many-to-Many

Common Entity Relationship Diagram Symbols - **Cardinality**

While **cardinality** specifies the **occurrences** of a relationship, **ordinality** describes the **relationship** as either mandatory or optional.

In other words, cardinality specifies the maximum number of relationships and ordinality specifies the absolute minimum number of relationships.

Crow's Foot

Bachman Style

one to one

zero or more to one or more

one to one or more

Martin Style

1 - one, and only one (mandatory)

* - many (zero or more - optional)

1...* - one or more (mandatory)

0...1 - zero or one (optional)

(0,1) - zero or one (optional)

(1,n) - one or more (mandatory)

(0,n) - zero or more (optional)

(1,1) - one and only one (mandatory)

Constructing ER Diagram

Identify the entities.

The first step in making an ERD is to identify all of the entities you will use. An entity is nothing more than a rectangle with a description of something that your system stores information about.

This could be a customer, a manager, an invoice, a schedule, etc. Draw a rectangle for each entity you can think of on your page. Keep them spaced out a bit.

Constructing ER Diagram

Identify relationships.

Look at two entities, are they related? If so draw a solid line connecting the two entities.

Describe the relationship.

How are the entities related? Draw an action diamond between the two entities on the line you just added. In the diamond write a brief description of how they are related.

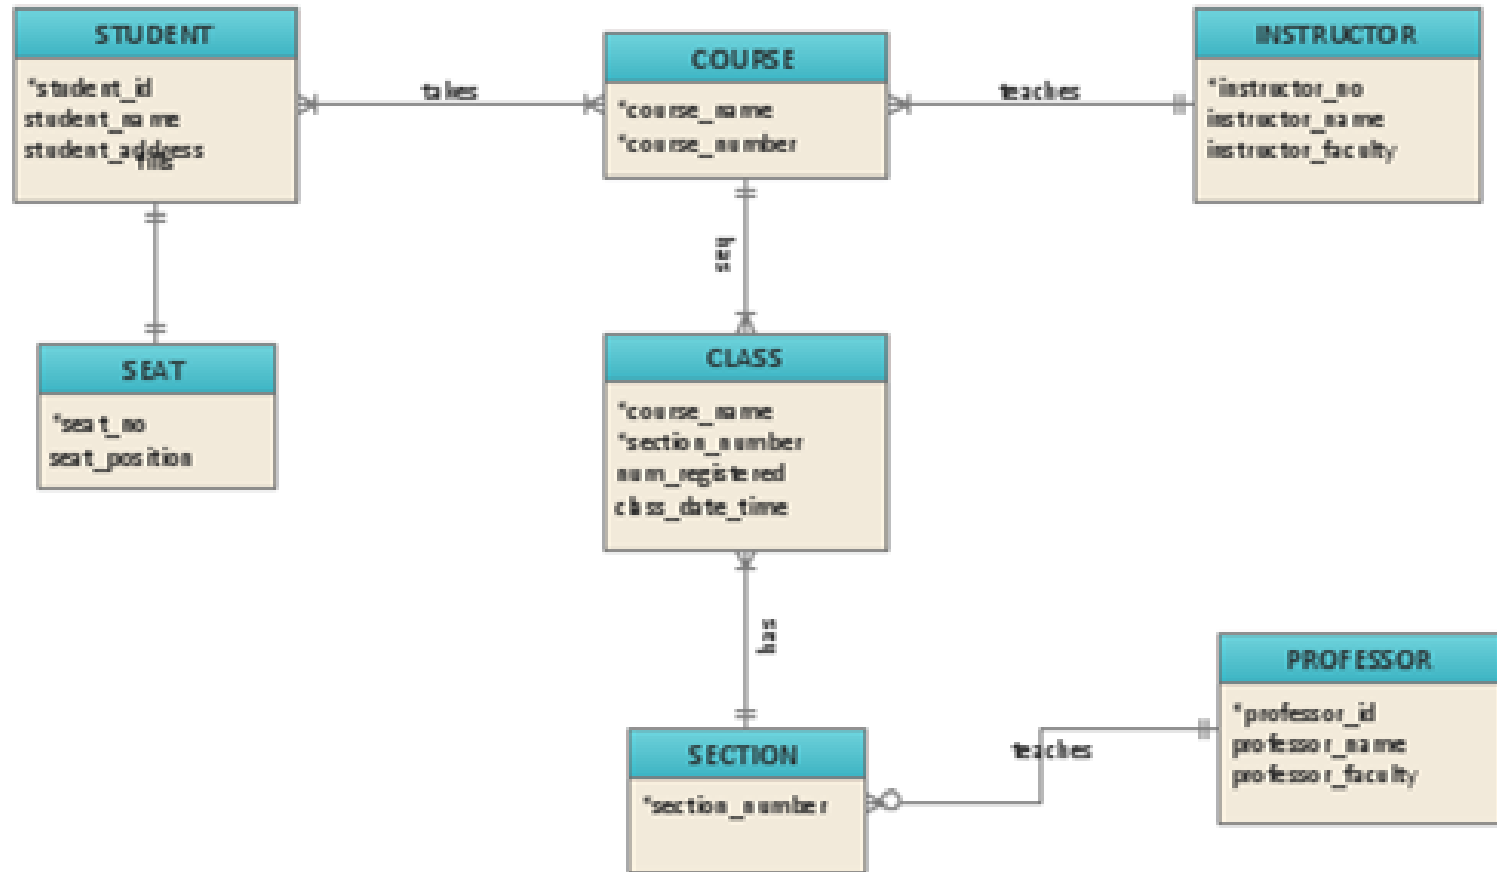

Constructing ER Diagram

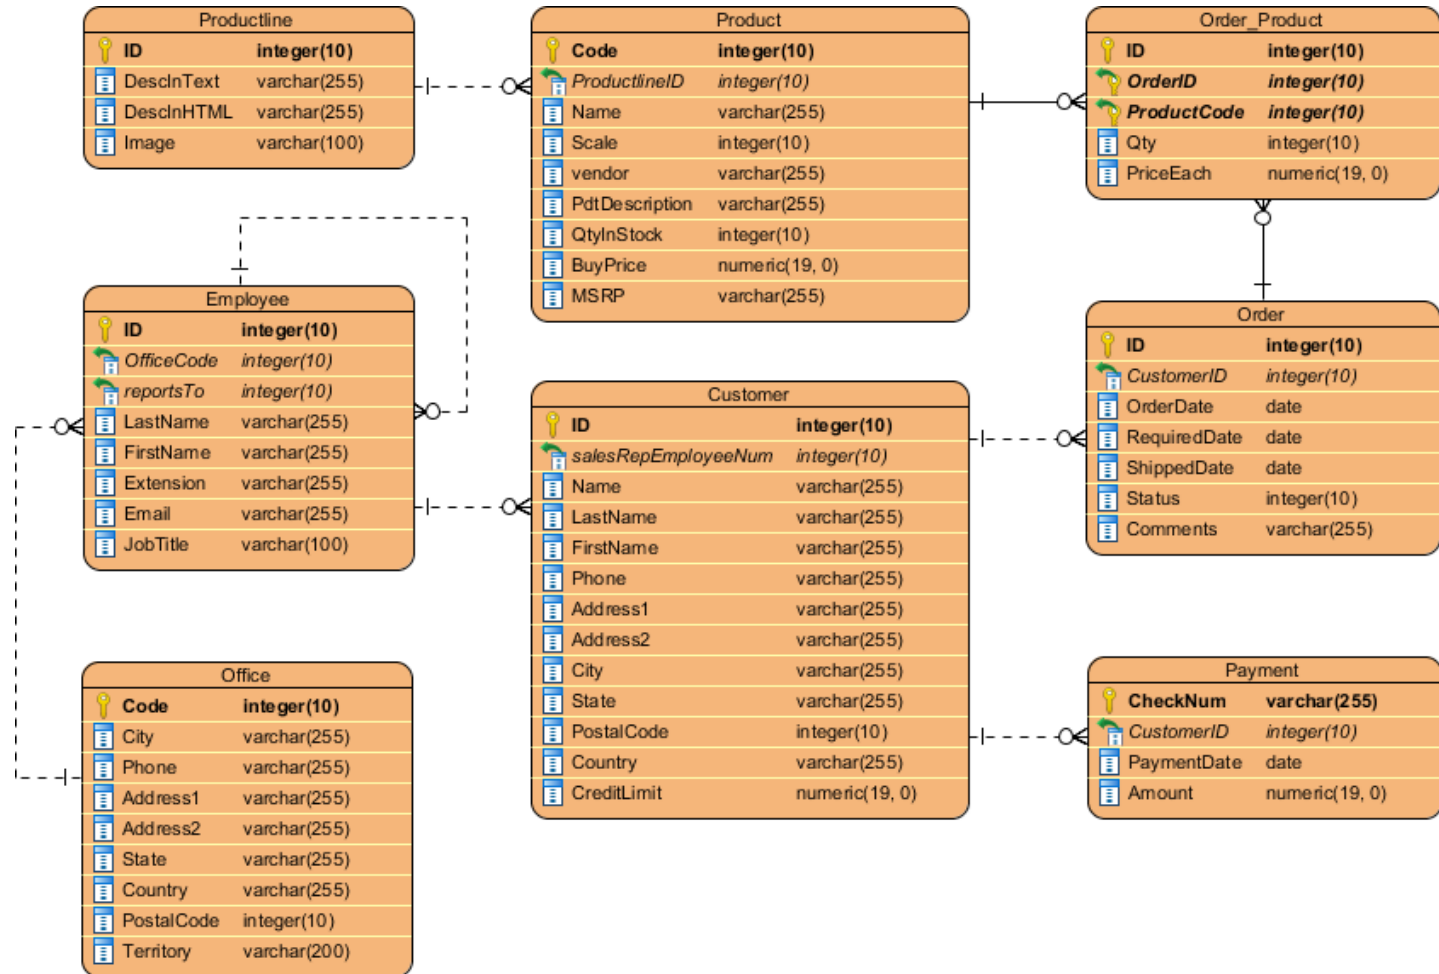

Add attributes.

Any key attributes of entities should be added using oval-shaped symbols.

Complete the diagram.

Continue to connect the entities with lines, and adding diamonds to describe each relationship until all relationships have been described. Each of your entities may not have any relationships, some may have multiple relationships. That is okay.

The End
